

# AccountMate 6.0

## *Kitting*

(Requires Inventory Control)

With the **AccountMate 6.0's Kitting** module, you can add the power of kitting to your Inventory Control module, creating and managing groups of inventory items packaged together as kits (such as the components of a computer system) and sold to others for assembly. Kitting integrates with the AccountMate Accounts Receivable and Sales Order modules.

AccountMate 6.0's Kitting module is designed for use by manufacturers whose goods are often resold in many different configurations. This module enables you to track items as they are sold either individually or as components of a Kit, equipping you to make wise and up-to-the minute production decisions.

### ACCOUNTMATE 6.0 KITTING FEATURES

#### Creating Kit Items

Kit items are inventory items created by packaging units of other inventory items together for sale to and assembly by the customer. (For example, instead of assembling a complete bicycle for sale, or selling each part as a separate item, the manufacturer might package a kit consisting of the frame, wheels, handlebars, seat and pedals, which the purchaser could easily assemble.)

Kit Formula Maintenance is further enhanced so a non-stock item can be designated as a component of a kit formula. You are not limited to stock items, saving time and disk space since there is no need to create item records that will be used only once.

#### Building Kit Items

AccountMate provides the ability to simultaneously build and ship kit items within one window. You can elect to ship kit items without going through the Build Kit Item function by deactivating the Require Pre-build option in the inventory record. This enables faster order processing.

#### Disassembling Kit Items

If a kit item unit is disassembled because it is overstocked or its parts are needed for a separate sale, the disassembly and disposition of its parts is recorded through the Maintenance menu of either the Inventory Control or the Sales Order module, whichever is applicable.

#### Using Kit Numbers

You can choose whether or not to assign kit numbers to kit item units. Kit numbers can be used for item identification as well as for additional production run information.

#### Tracking In-house Movement of Kit Items

When moving units of an item from one warehouse or bin to another, you can specify the kit numbers of the units being moved.

#### Identifying Kit Items

Kit items are clearly flagged on their inventory records and on the transaction lines of sales orders, invoices and shipped sales orders.
